

Traffic analysis for HTTP, FTP/SFTP, e-mail and WebDAV

The following analysis shows your monthly data transfer volumes for the current year, divided up into HTTP, FTP, e-mail and WebDAV. A summary is shown in the first two columns.

HTTP, WebDAV and FTP/SFTP traffic is based on the access.log.<week>.<weekday>, dav.log.<week>.<weekday>, ftp.xferlog and sftp.log files respectively, located in your '/logs' directory (separate FTP transfer logs apply to packages with a non-shared IP address only).

The column labeled "quantity" of the category mail indicates the number of e-mails that originated from scripts running on your virtual host. This does not include e-mails sent via mailing lists.

The number of megabytes in each category indicates how many megabytes were actually consumed by the specified number of requests.
